

Sports Event Scheduler – User Guide

This tool automatically fetches sports betting odds **1 minute before each game starts** and sends them to your Telegram bot. It also saves all data to a CSV file.

What You'll Need (One-Time Setup)

Before running anything, make sure the following are done **once**:

1. Install **uv** (the tool that runs the scripts)

Open **Command Prompt** (press **Win + R**, type **cmd**, hit Enter) and paste this:

```
powershell -c "irm https://astral.sh/uv/install.ps1 | iex"
```

Close and reopen Command Prompt after it finishes.

2. Set up your credentials in the **.env** file

Open the **.env** file (it's in the same folder as the scripts) in Notepad and make sure it has these three lines filled in:

```
AUTHORIZATION_KEY=your_key_here  
TELEGRAM_BOT_TOKEN=your_bot_token_here  
TELEGRAM_CHAT_ID=your_chat_id_here
```

 Never share this file with anyone. It contains your private keys.

How to Open the Folder in Command Prompt

1. Open **File Explorer** and go to the folder where these scripts are saved
 2. Click on the **address bar** at the top (it shows the folder path)
 3. Type **cmd** and press **Enter** — a Command Prompt window will open directly in that folder
-

Running the Scripts

Option A – Run the Scheduler (Recommended)

This is the **main script**. Run it once in the morning and leave it running all day.
It will automatically send odds to your Telegram **1 minute before each game starts**.

```
uv run scheduler.py
```

What Exactly Happens When You Run `scheduler.py`

Here is a step-by-step breakdown of everything the scheduler does – in plain English:

Step 1 – It starts and shows a startup message

```
=====
Event Scheduler started
Trigger: 60s before each event
Refresh interval: 60 minutes
=====
```

This confirms the script is alive and running.

Step 2 – It fetches today's game list immediately

```
[INFO] Refreshing event list...
[INFO] Event list refreshed – 10 new event(s) added. Total tracked: 10
```

It connects to the sports data source and loads all of today's scheduled games.

Step 3 – It checks the clock every 10 seconds

Behind the scenes, it keeps checking: *"Is any game starting in the next 60 seconds?"*
You won't see anything on screen during this time – that's normal. It's just waiting.

Step 4 – Exactly 1 minute before a game starts, it fires

```
[INFO] Triggering: Belgium vs. USA (starts: Jul 07, 2026 06:00 AM)
[INFO] Fetching odds for: Belgium vs. USA
[INFO] Telegram notification sent for event: Belgium vs. USA
[INFO] Updated CSV row for: Belgium vs. USA
```

For each game it:

1. Fetches the latest odds from the data source

2. Sends a formatted message to your Telegram bot
3. Saves/updates the row in `events_data.csv`

Step 5 – Every 60 minutes it re-fetches the game list

```
[INFO] Refreshing event list...
```

```
[INFO] Event list refreshed – 2 new event(s) added. Total tracked: 12
```

If any new games were added to the schedule during the day, they get picked up automatically.

Step 6 – If it missed a game (started the script too late)

```
[WARNING] Missed window for: Spain vs. Portugal (started: Jul 07, 2026  
01:00 AM)
```

This just means that game had already started by the time the script ran. No action needed – it moves on to the next upcoming game.

Step 7 – It keeps running until you stop it

Press `Ctrl + C` to stop the scheduler at any time.

✅ **Best practice:** Start the scheduler first thing in the morning before any games begin.

▶ Option B – Send All Events Right Now

If you want to **immediately send all of today's events** to Telegram (useful for reviewing the day's slate):

```
uv run send_all_events.py
```

This runs once and exits. It sends all games with their current odds to your bot.

What Happens in Telegram

For each game, you'll receive a message like this:

⚾ [MLB] New York Yankees vs. Tampa Bay Rays

🕒 Starts: Jul 07, 2026 04:40 AM

📊 ODDS (Full Game)

Moneyline: Tampa Bay Rays 6.06 | New York Yankees 1.18

Spread: Tampa Bay Rays @ 1.65 | New York Yankees @ 1.44

Total: Over 2.06 | Under 1.87

Moneyline:

Tampa Bay Rays 44.18% bets / 56.8% money

New York Yankees 55.82% bets / 43.2% money

Spread:

Tampa Bay Rays 56.1% bets / 44.39% money

New York Yankees 43.9% bets / 55.61% money

Total:

Over 47.44% bets / 43.4% money

Under 52.56% bets / 56.6% money

The CSV File (`events_data.csv`)

After running either script, a file called `events_data.csv` will appear (or update) in the same folder.

- Open it with **Microsoft Excel** or **Google Sheets**
- Each row = one game with all its odds and consensus data
- If a game already exists in the file, its row gets **updated** (no duplicates)

Files in This Folder (What Each One Does)

File	Purpose
<code>scheduler.py</code>	 Main script – runs all day, sends alerts 1 min before each game
<code>send_all_events.py</code>	Sends all today's games to Telegram immediately (one-shot)
<code>events_data.csv</code>	The output CSV file with all game data
<code>.env</code>	Your private credentials (do not share)
<code>all_events.py</code>	Fetches the list of today's games (used internally)
<code>get_odds.py</code>	Fetches odds for a single game (used internally)
<code>notifier.py</code>	Sends the Telegram message (used internally)
<code>storage.py</code>	Saves data to the CSV (used internally)
<code>scheduler.log</code>	Log file – shows what the scheduler did and any errors

Troubleshooting

"uv is not recognized"

→ Restart Command Prompt after installing `uv` , or restart your computer.

Telegram message not arriving

→ Check that `TELEGRAM_BOT_TOKEN` and `TELEGRAM_CHAT_ID` in `.env` are correct.

→ Make sure you've sent at least one message to your bot first (open Telegram, find your bot, press Start).

"No events found" or script crashes

→ Check that `AUTHORIZATION_KEY` in `.env` is correct and not expired.

"Script shows 'Missed window' for all events"

→ This is normal if you start the scheduler after games have already begun. Start it fresh the next morning.
